7/27

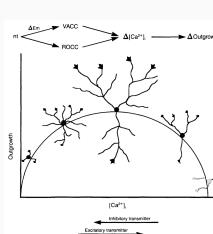

## What we know from these experiments

- Massive disinhibition in the LPZ.
- Gradual ingrowth of excitatory synapses from the peri-LPZ to the LPZ.
- Gradual outgrowth of inhibitory synapses from the LPZ to the peri-LPZ.

9/27

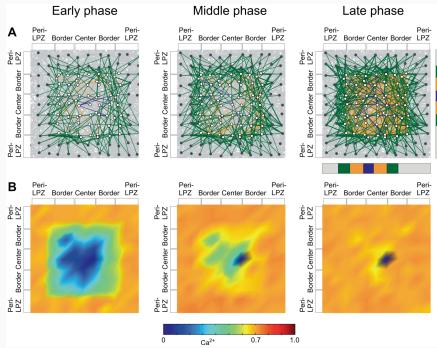

## Computational modelling: MSP: turnover

- Synaptic structures ( $z$ ): excitatory **and** inhibitory post-synaptic, excitatory **or** inhibitory pre-synaptic elements.
- New synapses form when **free** plugs are available: ( $z > z_{\text{conn}}$ )
- Synapses are deleted if: ( $z < z_{\text{conn}}$ )

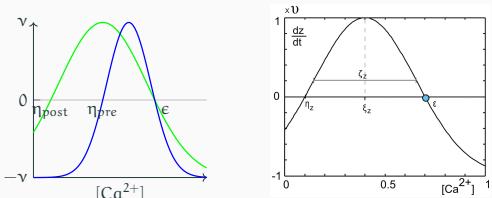

10/27

## Computational modelling II: Butz2013 replication

11/27

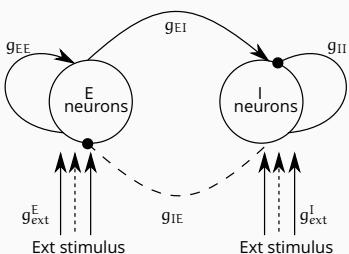

## Computational modelling II: Butz2013 results

12/27

## Methods: our approach

## Start with a biologically realistic network model

<sup>4</sup>Vogels, T. P. et al. Inhibitory plasticity balances excitation and inhibition in sensory pathways and memory networks. *Science* 334, 1569–1573 (2011)

13/27

## Extensions

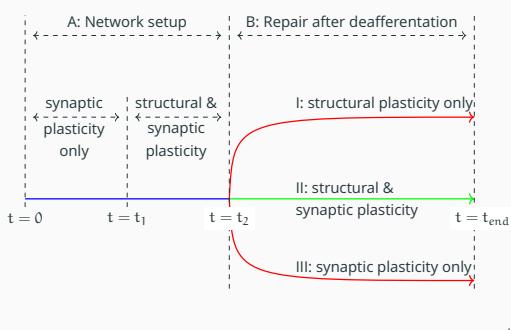

- Probabilistic formation of synapses, also: “longer” inhibitory than excitatory connections<sup>1</sup>.
- Probabilistic deletion of synapses (incorporating evidence that stronger synapses have less likelihood of removal<sup>2</sup>).
- Further generalisation of growth curves.

<sup>5</sup>Citation buried in my lab logs somewhere!

### Simulation protocol

15/27

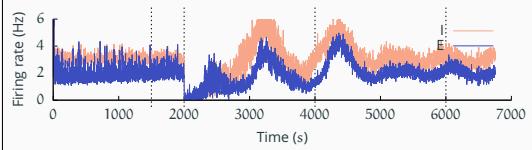

### Results and discussion

#### Deafferentation and successful repair

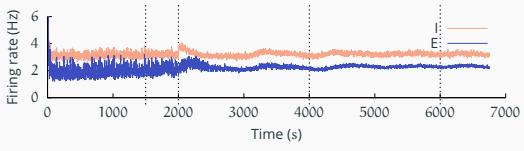

16/27

#### Deafferentation and repair: LPZ

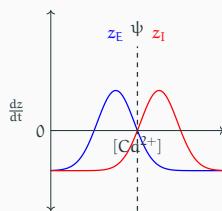

17/27

#### Deafferentation and repair: outside the LPZ

18/27

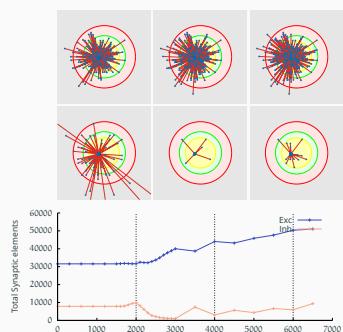

#### Post-synaptic growth dynamics

- Loss of activity: sprouting of E, retraction of I
- Extra activity: retraction of E, sprouting of I

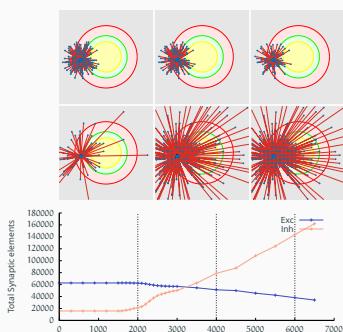

19/27

#### Resultant turnover: LPZ

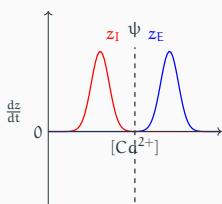

20/27

#### Resultant turnover: outside LPZ

21/27

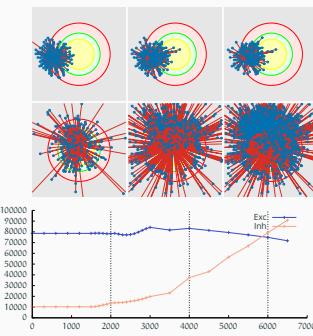

### Pre-synaptic growth dynamics

- Extra activity: sprouting of E
- Less activity: sprouting of I

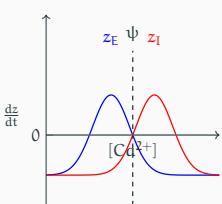

22/27

### Resultant turnover: pre-synaptic

23/27

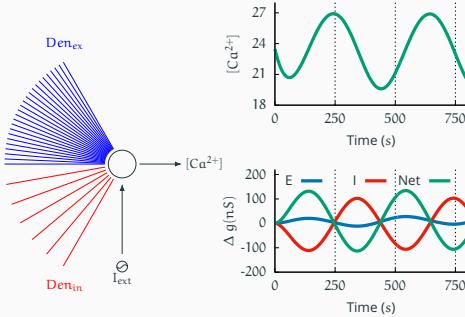

### Post-synaptic growth dynamics

- Loss of activity: sprouting of E, retraction of I
- Extra activity: retraction of E, sprouting of I

24/27

### Post-synaptic dynamics: single neuron stability

25/27

### Conclusions

- New model: biologically realistic.
- Replicates experimental observations:
  - Ingrowth of excitatory axons to LPZ.
  - Outgrowth of inhibitory axons from LPZ.
  - Massive disinhibition in LPZ.
  - Role of inhibition in structural plasticity as a controller of critical time window?
- Suggests:
  - Activity dependent dynamics for synaptic structures.
  - Single neuron stabilisation by structural plasticity.

26/27

### Now what?

- Functional implications of structural plasticity? Associative memory?
- Application of growth dynamics to multi-compartmental neuron models?
- Faithful modelling of cytoskeleton modification (actin)?

27/27
