The brain: learning, plasticity, stability

2019-04-15

Investigating activity dependent dynamics of
synaptic structures using biologically plausible
models of post-deafferentation network repair

The brain: neurons

Dendrites, Oxford University Press, 2015; Modified from Mel, B.W. Neural Computation, 1994.

2019-04-15

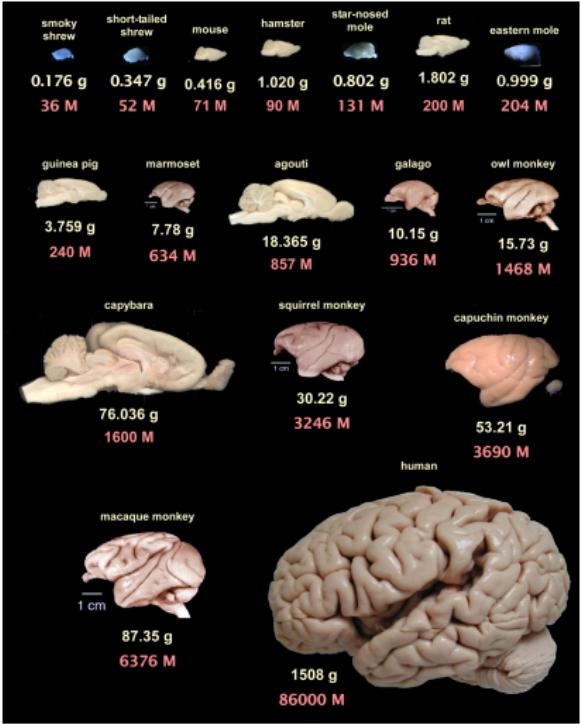

Investigating activity dependent dynamics of synaptic structures using biologically plausible models of post-deafferentation network repair

1. The brain is composed of specialised cells that enable it to process information by the use of electrical impulses
2. As the figure shows, these cells, neurons, have specialised into many many types. They serve different functions, include different proteins and markers, and can be classified in many different ways.

The brain: neurons

The brain: in numbers: neurons

- 86000M neurons¹.

The brain: plasticity and learning

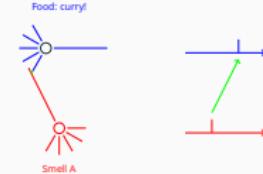

Food: curry!

2019-04-15

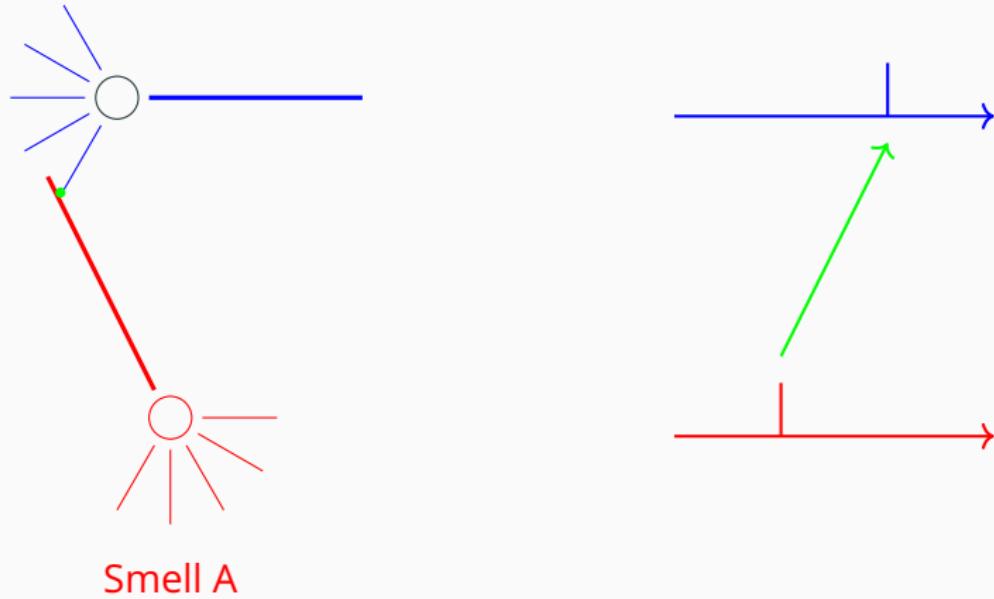

Investigating activity dependent dynamics of synaptic structures using biologically plausible models of post-deafferentation network repair

1. We learn when synapses change in the brain
2. As an example, let's say we have a neuron that was activated by a smell.
3. Later, we found out that that was the smell of some food, say curry.
4. Because these neurons fired one after the other here, this synapse is strengthened.
5. When this happens repeatedly, the synapse is strengthened again and again.
6. Until, the faintest whiff of the smell reminds you of the food!

The brain: plasticity and stability?

- Learning occurs all the time.

2019-04-15

Investigating activity dependent dynamics of synaptic structures using biologically plausible models of post-deafferentation network repair

- Changes in whole synapses change the structure of the networks of neurons, and is referred to as structural plasticity
- This led researchers to investigate stabilising processes which must work in parallel with learning

• Learning occurs all the time.

Our research focus

- We study homeostatic structural plasticity.

2019-04-15

Investigating activity dependent dynamics of synaptic structures using biologically plausible models of post-deafferentation network repair

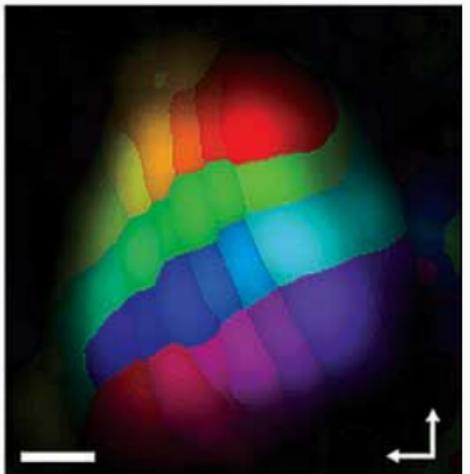

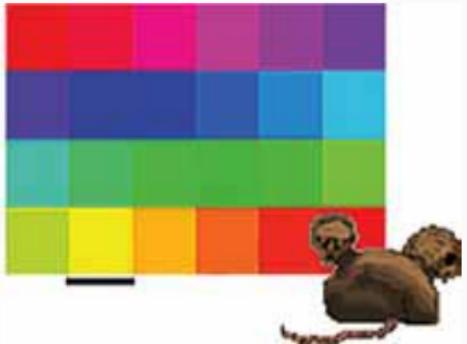

• We study homeostatic structural plasticity.

Homeostatic structural plasticity

2019-04-15

Investigating activity dependent dynamics of synaptic structures using biologically plausible models of post-deafferentation network repair

Studying homeostatic structural plasticity: biologists

2019-04-15

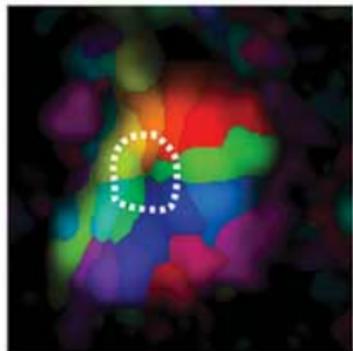

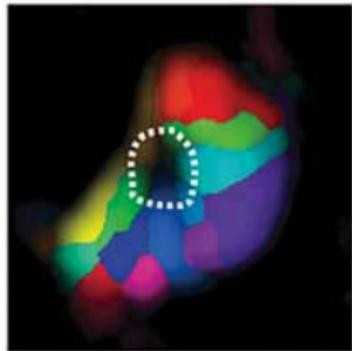

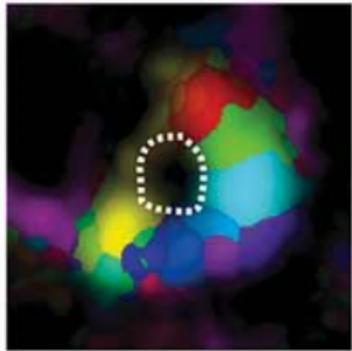

Investigating activity dependent dynamics of synaptic structures using biologically plausible models of post-deafferentation network repair

1. The protocol is pretty standard. Here, for a study in the visual cortex, the retinal field of a rat or a mouse is mapped.

1. Then, a part of the retina is lesioned. This cuts off inputs to a part of the visual cortex, as shown in the first figure. This forms the Lesion Projection Zone (LPZ). By repeated imaging of the region over months, the reorganisation of the network is tracked.
2. Other lesion studies use similar methods: digit removal, whisker trimming, and so on—anything that cuts off projecting activity on to a set of neurons.

Our investigations: computational modelling

- We make **models of small parts of the brain** on computers.
- We try to **replicate** what biologists observe in their laboratories.

2019-04-15

Investigating activity dependent dynamics of synaptic structures using biologically plausible models of post-deafferentation network repair

1. Really small parts: 10000 neurons only

- We make **models of small parts of the brain** on computers.
- We try to **replicate** what biologists observe in their laboratories.

Our investigations: computational modelling

- We make **models of small parts of the brain** on computers.
- We try to **replicate** what biologists observe in their laboratories.
- Modelling gives us **flexibility**:
 - we can change whatever we want, record whatever we want.
 - analyse data, test different hypotheses.
