What we know from these experiments

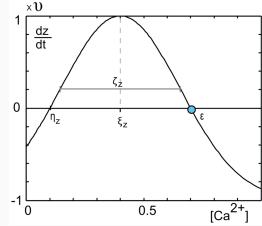

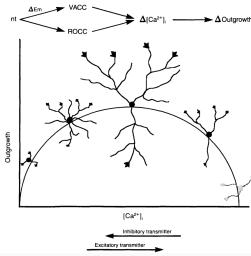

- Massive disinhibition in the LPZ.
- Gradual ingrowth of excitatory synapses from the peri-LPZ to the LPZ.
- Gradual outgrowth of inhibitory synapses from the LPZ to the peri-LPZ.

9/27

Notes

Computational modelling: MSP: turnover

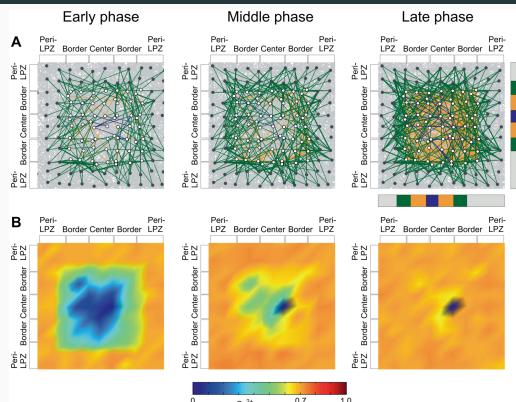

- Synaptic structures (z): excitatory and inhibitory post-synaptic, excitatory or inhibitory pre-synaptic elements.
- New synapses form when free plugs are available: ($z > z_{\text{conn}}$)
- Synapses are deleted if: ($z < z_{\text{conn}}$)

Methods: our approach

Start with a biologically realistic network model

⁴Vogels, T. P. et al. Inhibitory plasticity balances excitation and inhibition in sensory pathways and memory networks. *Science* **334**, 1569–1573 (2011)

13/27

Extensions

- Probabilistic formation of synapses, also: “longer” inhibitory than excitatory connections¹.
 - Probabilistic deletion of synapses (incorporating evidence that stronger synapses have less likelihood of removal²).
 - Further generalisation of growth curves.

⁵Citation buried in my lab logs somewhere!

⁶Knott, G. W. et al. Spine growth precedes synapse formation in the adult neocortex *in vivo*. *Nature neuroscience* **9**, 1117–1124 (2006)

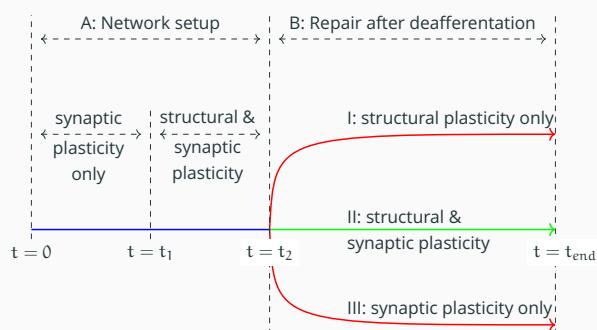

Notes

Post-synaptic dynamics: single neuron stability

25/27

Notes

Conclusions

- New model: biologically realistic.
- Replicates experimental observations:
 - Ingrowth of excitatory axons to LPZ.
 - Outgrowth of inhibitory axons from LPZ.
 - Massive disinhibition in LPZ.
 - Role of inhibition in structural plasticity as a controller of critical time window?
- Suggests:
 - Activity dependent dynamics for synaptic structures.
 - Single neuron stabilisation by structural plasticity.

26/27

Notes

Now what?

- Functional implications of structural plasticity? Associative memory?
- Application of growth dynamics to multi-compartmental neuron models?
- Faithful modelling of cytoskeleton modification (actin)?
